

NOT ALL BIOFUELS LEAVE A SMALL FOOTPRINT

LET'S CHOOSE THE CLEAN PATH FROM THE START.

The mandate for 36 billion gallons of biofuels production would leave a large and destructive environmental footprint. Without adequate safeguards, the rush to produce biofuels will take over forests, wildlands and conservation areas, and increase pollution. But it's not too late to get biofuels right. Congress should get us moving down the right path by protecting these lands, and by ensuring advanced renewable fuels produce 50% less global warming pollution than gasoline.

Visit www.nrdc.org/smallfootprint to make sure we get biofuels right.
